Try the user experience for ADHD apps; see what works well and doesn't work. Choose 3 based on similarity. Give updates to Carla during the process (share the link) so we can progress without a meeting.

Phase 5 — User Experience (UX) & App Design

Goal

Transform the app's logic into a clear, intuitive, and ADHD-friendly user experience.

The objective is to design how users interact with the app, complete check-ins, receive recommendations, track progress, and provide feedback.

This phase focuses on usability, accessibility, and engagement rather than programming.

At the end of this phase, you will design:

Screen 1 – Home Screen (Start Check-In and View Insights)

Screen 2 – Check-In Screen (Stress, Focus, Fatigue, Motivation, and Context Questions)

Screen 3 – Cognitive State Results Screen (Display the detected Cognitive State)

Screen 4 – Recommendations Screen (Personalized recommendations based on the detected state)

Screen 5 – Feedback Screen (Allow users to indicate whether the recommendation was helpful)

Screen 6 – Insights Dashboard (Focus trends, stress trends, productive times, and recurring patterns)

You will then connect these screens into a clickable prototype that simulates the user experience from opening the app to receiving recommendations and reviewing personal insights.

Step A — Define the Core User Journey

Objective

Map the complete experience from opening the app to receiving support.

Questions to Answer

- What is the first thing the user sees?
- How many steps does the user need to complete?
- When does the app provide recommendations?
- How does the user respond to recommendations?
- How does the system collect feedback?

Deliverable

User Journey Map

Example:

Open App
↓
Complete Check-In
↓
Pattern Analysis
↓
Cognitive State Detected
↓
Recommendation Appears
↓
User Tries Recommendation
↓
Feedback Collected

Step B — Design the Check-In Experience

Objective

Design a quick and simple daily check-in.

Since users with ADHD may struggle with long forms, the process should be fast and low-friction.

Questions to Answer

- How many questions should appear?

- What type of inputs should be used?
- How long should the check-in take?

Deliverable

Check-In Screen Design

Example:

Stress Level
○ ○ ○ ○ ○

Focus Level
○ ○ ○ ○ ○

Fatigue Level
○ ○ ○ ○ ○

Current Activity
Dropdown Menu

Total time:
30–60 seconds

Step C — Design Recommendation Screens

Objective

Determine how recommendations are presented.

Questions to Answer

- How much information should appear?
- Should recommendations be shown one at a time?
- Should the user choose between options?

Deliverable

Recommendation Screen Mockups

Example:

Current State:

Cognitive Overload

Suggested Actions:
✓ Break task into smaller steps
✓ Take a 10-minute break
✓ Reduce distractions

Would you like to try one?

Step D — Design Feedback Collection

Objective

Allow users to tell the app whether recommendations were helpful.

This is important for future personalization.

Questions to Answer

- How should feedback be collected?
- How often should users provide feedback?
- How simple should the process be?

Deliverable

Feedback Flow

Example:

Did this recommendation help?

○ Yes
○ Partially
○ No

Step E — Design Progress & Insights

Objective

Help users recognize patterns in their own behavior.

The app should not only react to problems but also help users learn about themselves.

Questions to Answer

- What information should be shown?
- How can patterns be visualized?
- What insights would be useful?

Deliverable

Progress Dashboard Concept

Possible Insights:

- Most productive times
- Most common overload triggers
- Most effective interventions
- Weekly stress patterns
- Focus trends

Step F — Create Wireframes

Objective

Create visual sketches of the app before development.

The goal is to define layout and navigation, not colors or branding.

Deliverable

Wireframes for:

1. Home Screen
2. Check-In Screen
3. Recommendation Screen
4. Feedback Screen
5. Progress Dashboard

Tools:

- Figma
- Whimsical
- Miro

- Draw.io

Step G — Build a Clickable Prototype

Objective

Create an interactive prototype that simulates the user experience.

The prototype does not need to function technically.

It only needs to demonstrate:

- navigation
- user flow
- screen interactions

Deliverable

Clickable Prototype in Figma

Final Deliverables of Phase 5

By the end of this phase, the project should include:

1. User Journey Map
2. Check-In Design
3. Recommendation Screen Design
4. Feedback System Design
5. Progress Dashboard Concept
6. Wireframes
7. Clickable Prototype
