1. Improve resource accessibility (Highest Priority)

Issue: Many users expected the articles, videos, and learning resources to be clickable but they were not, causing confusion.

Changes:

- Make every resource card fully clickable (not just the icon).
- Add direct links to articles/videos whenever possible.
- If direct links cannot be provided, add a **Copy Title** button so users can easily search for the resource themselves.
- Add a clear visual cue that the cards are interactive (hover state, shadow, border, or arrow).

---

2. Simplify the recommendations page

Issue: Users felt the recommendations contained too much text and the primary action was unclear.

Changes:

- Rewrite recommendations using plain, concise language.
- Convert long paragraphs into bullet points.
- Replace or prioritize the primary CTA from **"Rate these recommendations"** to an action-focused button such as:
    - Start Strategy
    - Try This
    - Complete Activity
- Move the rating request until after the user finishes the strategy.

---

3. Improve check-in usability

Issue: Several questions felt confusing or restrictive.

Changes:

- Replace binary Yes/No questions with frequency scales where appropriate.
    - Example:
        - Never
        - Rarely

        - Sometimes
        - Often
        - Very Often
- Add missing answer options such as:
    - "No"
    - "Not sure"
    - "I haven't been diagnosed"
    - "None"
- Allow multi-select for questions where multiple answers may apply.
- Clarify ambiguous questions such as:
    - "Part of day"
    - "Mood swings"

---

4. Improve navigation during check-ins

Issue: Some users couldn't immediately find the Next button.

Changes:

- Reduce unnecessary white space.
- Keep the Next button visible without excessive scrolling.
- Consider making the Next button sticky at the bottom of the screen.

---

5. Add an onboarding/introduction screen

Issue: Some users initially thought the app diagnosed ADHD.

Changes:

- Add a welcome screen explaining:
    - The purpose of the app.
    - What it does.
    - What it does **not** do.
- Clearly state that the app supports self-management and is **not a diagnostic tool**.

---

6. Improve readability

Issue: Some users found the typography lacked contrast.

Changes:

- Increase font size where appropriate.
- Increase contrast between text and background.
- Strengthen the visual hierarchy using larger headings and bolder section titles.

---

7. Make cognitive state easier to understand

Issue: Users wanted clearer visual feedback.

Changes:

- Add color-coded status indicators:
  - 🟢 Green = Doing Well
  - 🟡 Yellow = Mild Concern
  - 🟠 Orange = Moderate Concern
  - 🔴 Red = High Concern
- Keep colors soft and accessible while maintaining sufficient contrast.

---

8. Add note-taking after each check-in

Requested by multiple users.

Changes:

- Add an optional journal/note section after completing each check-in.
- Save notes alongside daily entries so users can review them later.

---

9. Improve history and dashboard

Issue: Users wanted better access to previous data.

Changes:

- Allow users to reopen previous reports.
- Add filters for:
  - Last 7 Days
  - Last 30 Days
  - All Time

- Display long-term trends more clearly.

---

10. Add reminders

Changes:

- Allow users to schedule reminder notifications.
- Let users customize:
    - Reminder time
    - Reminder frequency

---

11. Make the Knowledge Center more engaging

Issue: Users felt long articles may be ignored, especially by people with ADHD.

Changes:

- Replace long articles with:
    - Short summaries
    - Bullet points
    - Videos
    - Infographics
    - Expandable sections ("Read More")
- Reduce cognitive load by minimizing large blocks of text.

---

12. Improve interactivity

Changes:

- Add hover and pressed states for all interactive cards.
- Make it obvious which icons and buttons are clickable.
- Ensure interactive elements have consistent visual feedback.

---

13. Enhance dashboard visuals

Requested by several users.

Changes:

- Add charts or graphs to visualize trends.
- Include simple illustrations or icons where appropriate.
- Avoid clutter while making the interface more visually engaging.

Preserve These Strengths (Do Not Change)

The following aspects received consistently positive feedback and should be maintained:

- ✔ Clean and uncluttered interface.
- ✔ Calming color palette.
- ✔ Simple, intuitive navigation.
- ✔ Daily check-in feature.
- ✔ Personalized recommendations.
- ✔ Friendly, non-clinical language.
- ✔ Minimal cognitive overload.
- ✔ Fast and responsive interface.

Priority Summary

🔴 **Critical (Must Fix)**

1. Make resources clickable.
2. Simplify recommendation page.
3. Improve check-in questions.
4. Fix Next button visibility.
5. Add onboarding/introduction.

🟡 **High Priority**

6. Improve readability.
7. Color-code cognitive states.
8. Add notes.
9. Improve history and trends.
10. Reminder notifications.

🟢 **Nice to Have**

11. More engaging Knowledge Center.

12. Better interaction feedback.
13. Richer dashboard visualizations.
